Backtracking Algorithm

In backtracking algorithms you try to build a solution one step at a time. If at some step it becomes clear that the current path that you are on cannot lead to a solution you go back to the previous step (backtrack) and choose a different path. Briefly, once you exhaust all your options at a certain step you go back.

Approach For Solving Sudoku Using Recursive Backtracking Algorithm

- 1. Like all other Backtracking problems, we can solve Sudoku by one by one assigning numbers to empty cells.
- 2. Before assigning a number, we need to confirm that the same number is not present in current row, current column and current 3X3 subgrid.
- 3. If number is not present in respective row, column or subgrid, we can assign the number, and recursively check if this assignment leads to a solution or not. If the assignment does not lead to a solution, then we try next number for current empty cell. And if none of number (1 to 9) lead to solution, we return false.
